CCSS.Math.Content.8.G.A.5 Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the angle-angle criterion for similarity of triangles. For example, arrange three copies of the same triangle so that the sum of the three angles appears to form a line, and give an argument in terms ...

It makes it easy to use big and small values. When the number is 10 or greater, the decimal point has to move to the left, and the power of 10 is positive. When the number is smaller than 1, the decimal point has to move to the right, so the power of 10 is negative ...

A root of a polynomial P(z) is a number z_i such that $P(z_i)=0$. The fundamental theorem of algebra states that a polynomial P(z) of degree n has n roots, some of which may be degenerate. For example, the roots of the polynomial $x^3-2x^2-x+2=(x-2)(x-1)(x+1)$ (1) are -1, 1, and 2. Finding roots of a polynomial is therefore equivalent to polynomial factorization into factors of degree 1.
